COMMUNICATION

Nucleotide Sequence of the Gene of *HgaI* Restriction Endonuclease

Hiroyuki SUGISAKI*

Received July 20, 1993

The nucleotide sequence reported in this paper has been submitted to the DDBJ, EMBL, and GenBank Data Bank with accession number D17388.

The abbreviations used are: bp, base pair(s); kb, kilobase pair(s); ORF, open reading frame; R-M system, restriction-modification system; *RHgaI*, *HgaI* restriction endonuclease; *MHgaI*, *HgaI* modification methylase; IPTG, isopropyl- β -D-thiogalactopyranoside

KEY WORDS: DNA cloning / *Haemophilus gallinarum* / Type IIS restriction-modification system / Expression in *E.coli*

The genes of a variety of the type II restriction-modification (R-M) systems that recognize symmetrical DNA sequences have been cloned and their gene organization and nucleotide sequences have been analyzed [see the reviews¹⁻³⁾]. As concerns the genes consisting of the type IIS R-M systems that recognize asymmetrical DNA sequences, however, only those of the *FokI*⁴⁾, *MboII*⁵⁾ and *StuI*⁶⁾ [the endonuclease recognizes the same DNA sequence as *FokI* endonuclease but cleaves at different positions⁷⁾] R-M systems have been reported so far.

The *HgaI* R-M system found in *Haemophilus gallinarum*, that belongs to this category, recognizes a 5 bp segment of DNA, consisting of 5'-GACGC-3' in one strand and 3'-CTGCG-5' in the other (*HgaI* recognition site). *HgaI* restriction endonuclease (*RHgaI*) introduces staggered cleavages 5 and 10 nucleotides downstream from the recognition sequences^{8,9)}. Experiments have been designed to clone the genes consisting of the system and a DNA fragment carrying the genes of two *HgaI* modification methylase (*MHgaI*) has been successfully isolated from a genomic DNA library of *H.gallinarum*¹⁰⁾. The two methylase genes are respectively responsible for modification of the internal cytosine residues of the CTGCG and GACGC strands and render DNA resistant to digestion by *RHgaI*. However, the *RHgaI* gene was not identified. Since the genes of restriction endonucleases are usually linked to those of the corresponding methylases on chromosome, truncated open reading frame 3 (ORF3) previously identified, which is located just downstream from the two *MHgaI* genes, is most likely to be the corresponding gene (see Fig.2 in Ref.10). The separation of the domains for DNA sequence recognition and cleavage makes type IIS restriction endonucleases interesting objects for studies of DNA-protein recognition. Therefore, an experiment was designed to clone the complete gene from the chromosomal DNA.

As to maintain the plasmid carrying a restriction endonuclease gene in *E.coli* cells, coexistence of the corresponding methylase gene is indispensable. First, the plasmid carrying the

*梶崎弘幸: Research Facility of Nucleic Acids, Institute for Chemical Research, Kyoto University, Uji, Kyoto 611, Japan

two *MHgaI* genes was constructed. The 2.9 kb region of pKS318¹⁰⁾ (from the leftmost *HindIII* site to the *XbaI* site at nucleotide position 2909, see Fig. 2) was inserted into the *HindIII*-*XbaI* region in the multicloning sites of pUC19¹¹⁾. Deletion was introduced from the *XbaI* site and a clone carrying a DNA fragment of nucleotide positions 1 to 2497 was isolated. The coding region for the two *MHgaI* genes could be just generated as a 2.4 kb fragment from the plasmid construct by *RNsp*(7524) V-*REcoRI* digestion and inserted into the *EcoRV* site of pACYC184¹²⁾ by blunt end ligation. The resulting construct carrying the two *MHgaI* genes under control of the *tet* promoter was named pKS430 (see Fig. 2) and introduced into *E. coli* MCH1061 cells¹⁰⁾.

Next, a DNA fragment adjacent to the insert of pKS318 on the *H. gallinarum* chromosome was searched. When digests of the chromosomal DNA by various restriction endonucleases were subjected to the Southern blotting hybridization¹³⁾ using, as probe, the 390 bp *XbaI*-*HindIII* fragment (nucleotide positions 2,909 to 3,399, see Fig. 2) which is located in the coding region for ORF3, an approximately 4.5 kb *ClaI* fragment was identified (data not shown). The DNA fragment would contain the region adjacent at the right side to the insert and a sufficient coding capacity for complete ORF3 because the *ClaI* site is located just upstream from the gene (see Fig. 2). Complete *ClaI* digests of the chromosomal DNA were fractionated by electrophoresis on 0.7% agarose gel, and fractions predominantly containing the fragments of 3.5-5.5 kb were collected. The sized *ClaI* fragments were ligated to a phosphatase-treated *AclI* digest of pUC19 and introduced into *E. coli* MCH1061 carrying pKS430. Among the recombinants examined by colony hybridization¹³⁾ using the *XbaI*-*HindIII* fragment as probe, one carrying ORF3 under control of the *lac* promoter in a single 4.5 kb *ClaI* fragment was named pKS456. The *RHgaI* activity was actually detected in the extract from the *E. coli* cells by induction with isopropyl- β -D-thiogalactopyranoside (IPTG). I, therefore, concluded that the 4.5 kb *ClaI* fragment contains the *RHgaI* gene.

The nucleotide sequence of the region adjacent to the insert of pKS318 was determined using the dideoxy sequencing method^{14,15)}. The DNA sequence of the 1.8-kb leftmost *ClaI* to *HincII* region of pKS456 is shown in Fig. 1. Analysis of coding capacities indicated that ORF3 terminates at nucleotide position 3808.

To verify that ORF3 is indeed the *RHgaI* gene, the endonuclease activity was determined by the *in vitro* assay procedure. The leftmost 1.6 kb region of the 4.5 kb *ClaI* fragment (from the *BamHI* site on the pUC19 moiety to the *EcoT22I* site, see Fig. 2) which encompasses entire ORF3 was inserted into the *BamHI*-*PstI* region in the multicloning sites of the expression vector pKK223-3 (Pharmacia P-L Biochemicals Inc.). The resulting construct carrying ORF3 under control of the *tac* promoter was named pKS475. The plasmid construct was introduced into *E. coli* MCH1061 cells carrying pKS430 and after induction with IPTG, protein expressed from the gene was purified by phosphocellulose (Whatman), heparin-agarose (Bethesda Research Laboratories), and hydroxyapatite (Clarkson Chemical Co.) columns. When the various DNAs were digested with the purified protein fraction and authentic *RHgaI* isolated from *H. gallinarum* cells, the same restriction patterns were obtained (data not shown). The results clearly indicated that ORF3 was the *RHgaI* gene. In ORF3, the ATG codon occurred at nucleotide positions 2345 and 2360. The predicted molecular weights of proteins beginning with ATG at nucleotide positions 2345 and 2360 were 56,734 and 56,119, respectively. I assigned the ATG codon at 2360 to the initiation site for translation of the endonuclease for only this one was accompanied by a putative ribosomal-binding sequence, 5'-GGAG-3',

Fig.1 Nucleotide sequence of the leftmost *Clal* to *HincII* region of the 4.5 kb insert in pKS456. The amino acid sequence assigned for *RHgaI* are given below the nucleotide sequence. The nucleotide sequence is numbered from the leftmost end of pKS318⁹⁾, and the amino acid sequences from the first initiation codon, respectively.

Fig.2. Gene organization of the *HgaI* R-M system. The filled line represents the region of which the DNA sequence was determined as shown in Fig.1 and open line the other region for *H.gallinarum* chromosomal DNA. Below the physical map on which the major restriction sites are indicated, the two methylase and one endonuclease genes are shown by open arrows, and the region inserted into the plasmid construct in this experiment are indicated by bold lines.

in the appropriate position. To confirm this assignment, I have a plan to analyze the N-terminal amino acid sequence.

The gene organization of the *HgaI* R-M system derived from Ref.10 and this paper is shown in Fig.2. This R-M system is consisted of two cytosine methylase genes responsible for modification of different DNA strands in the target DNA and a endonuclease gene for cleavage of both DNA strands.

Acknowledgments

I wish to thank Dr. M. Takanami for his instructive advice and criticism during the course of this work.
